## **Concept for the DPF-System**

---

### **Methods of Regeneration**

- **Active System**
- **Regeneration by Heating the Soot to the Ignition Temperature by Microwave Radiation**
- **Engine Management System**
- **Specifications for Vehicle Construction**

## Concept for the DPF-System

Relevant parameters for an ideal design of the plant to the heated goods

1. Energy Source: Generator (e.g. Magnetron) characterized by Frequency and Output
2. Microwave Transfer Element (Geometric Design of the Wave Guide)
3. Microwave Applicator (Geometric Design of the MW-Applicator)
4. Measurement and Control Devices:  
Output and Temperature Measurement
5. Further:
  - Geometry of the Raw Material
  - Material Properties of the Raw Material
  - Material Properties of the Applicator Walls

## Concept for the DPF-System

**Figure 1:** Design of a microwave assisted DPF Cleaning System

## Numerical Simulation: Results

Example: Multimode Applicator with an Axial Microwave Discharge

Figure 2: Numerical 3D-Simulation: E-Field and Heat Source Density Distribution

## Numerical Simulation: Results

Example: Multimode Applicator with a Radial Microwave Discharge

### Heat Sources:

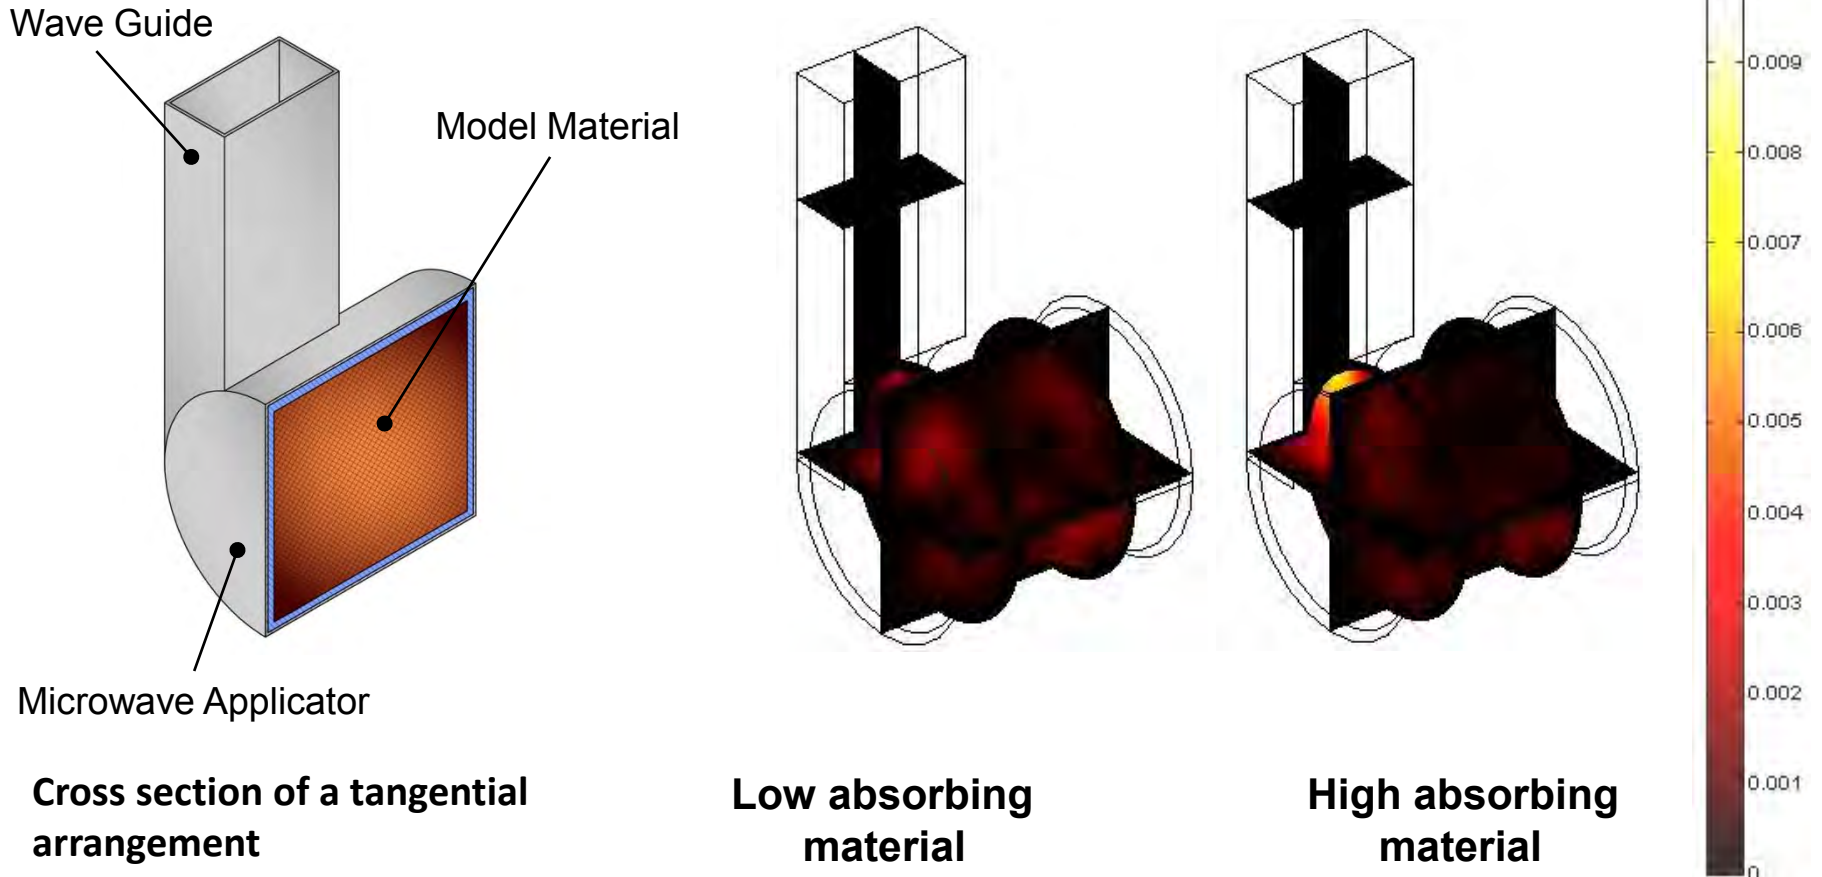

Figure 3: Numerical 3D-Simulation: Heat Source Density Distribution

## Numerical Simulation: Results

Example: Multimode Applicator with a Tangential Microwave Discharge

Cross section of a tangential arrangement

Low absorbing material

High absorbing material

Figure 4: Numerical 3D-Simulation: Heat Source Density Distribution

## Numerical Simulation: Results

---

### The simulation leads to a couple of possibilities:

- Simulation of different heating mechanism according to the geometry and general conditions of the plant
- Comparison with experimental pre-heating trials
- Optimized plant design according to the good to be heated
- Reduction in production time
  - Reduction in heating-up, processing and cooling time
  - Only heating of the good (no heating of the air volume and walls of the reactor)

**A mathematical optimization of the design of a microwave assisted diesel sooty particle filter cleaning system is possible, but an experimental validation is indispensable.**

## Experimental Validation: Experimental Station

Cylindrical Multimode-Applicator  
with tangential Microwave Discharge

Experimental Station, Back Side

Measuring Zone

<i>Parameter</i>	<i>Multimode-Applicator</i>	<i>Cordierite-DPF</i>
Length, mm	168	152,4
Diameter, mm	161	143,76
Wall thickness, mm	3	0,1
Volume, l	3,42	2,5
Filling factor	0,73	

## Experimental Validation: Results

Partially Regenerated Cordierite-honeycomb filter

**Figure 5: Regeneration of the loaded filter by microwave radiation**

## Experimental Validation: Results

E-Field Strength Distribution

Heat Source Distribution

Temperature Distribution  
at  $t = 200$  s

**Figure 6: Numerical 3D-Simulation: E-Field Strength, Heat Source Density- and Temperature Distribution**

**Numerical 3D-Simulation of the Temperature Distribution**

**Infrared Camera – Temperature Measurement**

Back Side at  $t = 150$  s

Front Side at  $t = 150$  s

Parameter	Model	Experiment
$P_{in}$ , W	572	572
$P_{abs}$ , W	532	545
$P_{ref}$ , W	40	27
$P_{abs\ Wall}$ , W	0,02	-
$\eta$ , %	93	95,3
$R_0$	0,26	0,22
VSWR	1,72	1,56
$T_0$ , °C	20	20
$T_{max}$ , °C	165,6	~170

Figure 7: Results of the experimental validation [Reference: Imenokhoyev, 2007]

## Conclusion

---

- 1** The numerically and experimentally determined temperature field distributions match excellent in quality and quantity.
  
- 2** The 3D-FEM-models created with COMSOL Multiphysics provide practice-orientated results.
  
- 3** They can be used for a computer-assisted modeling and optimization of microwave heating.
